Rako installs laser system for rotary screens (10.01.2007)

Leading European label converter RAKO Etiketten has installed a direct laser engraving system for high-volume imaging of screen cylinders at its Witzhave (near Hamburg) works. The installation will enable the company to image rotary screens with greater speed and efficiency, while reducing production costs significantly.

Due to the sheer volume of screens used by the company, RAKO chose the rotaLEN 5511 laser engraver, which is dedicated to imaging Stork's nickel RotaMesh screens in a totally digital manner, free of film and chemicals.
